*Bathyconchoecia lacunosa*

1

**Key to drawings**

Adult carapaces (A,B females, C,D males)

Details of the first antennae and frontal organs and the endopodite of the left second antennae of females (E and F) and males (G and H)

Details of the armature of the male first antenna setae (I)

*Bathyconchoecia lacunosa* (Müller, G.W., 1906)

Records: 1

Originally described as a *Euconchoecia* species, this species was attributed to the new genus *Bathyconchoecia* by Deevey (1968b). The majority of *Bathyconchoecia* species are benthopelagic deep slope environments or abyssal depths. Relatively few have been reported either high in the water column or over continental shelves. So the two reports of *B. lacunosa* from shallow shelf seas from along the eastern coast of India (James, 1973) are almost certainly a different species.
